Product Design Specifications Respiratory Demonstration Device

Janelle Anderson, Malini Soundarrajan, Chris Goplen, Lynn Murray, Kristen Seashore May 6th, 2008

PURPOSE & DEVICE FUNCTION:

Currently, a basic balloon and latex membrane model is being used to represent the lungs, and diaphragm, respectively for classroom instructional purposes. While they demonstrate respiratory mechanics, the models have a short lifespan and do not display alveolar and intrapleural pressure changes.

Our goal is to design and build an adequate mechanical respiratory model for class instruction purposes. This model should demonstrate pressure differences between alveolar and intrapleural spaces. It must further demonstrate the expansion of the thoracic cavity from the rib cage as well as the diaphragm, thereby displaying a 3-D expansion. The device should be compatible with BioPac® software to graphically display intrapleural and alveolar pressure changes. The device must also be portable and small enough to use with a document camera.

CLIENT REQUIREMENTS:

- Long-lasting, easily replaceable parts
- Portable
- Displays alveolar and intrapleural pressures
- Operable by one user
- Compatible with BioPac® software

DESIGN REQUIREMENTS:

1. Physical and Operational Characteristics

a. Performance Requirements

i. Reusable. The unit will be used about four weeks per year, so the pieces should be durable.

- ii. Easily replaceable lungs and diaphragm.
- iii. Operable by a single user.
- b. Safety

i. Non-toxic and non-absorbing materials.

ii. Durable. The device should withstand regular usage.

iii. No sharp edges. Edges should be rounded to prevent any cuts or

scrapes from being incurred by the demonstrator or students.

c. Shelf Life

i. Approximately 30 years.

d. Operating Environment

i. Lecture hall and laboratory instructional settings.

ii. Between room temperature and temperature of document camera (25° C- 30° C).

e. Size

i. Must fit on or near a document camera for lecture demonstrations (13" x 17").

ii. Portable such that a professor or lab instructor can lift the device and accessories to transfer it easily to and from classrooms.

iii. Device should be small enough to fit in a standard cabinet or storage closet for easy storage.

f. Weight

i. The device should weigh less than 15 pounds so that it can be transported, without inducing excessive stress on the lab instructor's arm and back muscles.

g. Pressure Measurement

i. Must display alveolar and intrapleural pressures relative to each other.

ii. Digital gauges to integrate with BioPac®.

iii. Pressure measurements should be easily readable using lecture document camera.

iv. Pressure measurements should also be plotted on BioPac® software for use in a laboratory setting.

h. Aesthetics

i. Transparent container to better visualize lung mechanics. Membrane material does not need to be transparent.

ii. Red colored lungs to enhance physiological representation.

iii. Cylindrically shaped container to model the thoracic cavity.

2. Production Characteristics

a. Quantity: 1 unit

b. Target Product Cost: under \$500

3. Miscellaneous

a. Competition:

i. Acrylic model with latex diaphragm and balloon lungs

b. Ethics:

i. Model could replace use of animals in teaching students.
