

Tibial Stent Design Team Progress Report

Client: Dr. Matthew Halanski

Advisor: Dr. Paul Thompson

Team: Evan Lange *elange2@wisc.edu (Team Leader)*
Karl Kabarowski *kabarowski@wisc.edu (Communicator/BSAC)*
Tyler Max *tmax@wisc.edu (BPAG)*
Sarah Dicker *sdicker@wisc.edu (BWIG)*

Date: February 28th, 2014 – March 7th, 2014 (Week 6)

Problem Statement

(revised 02/03/14)

Tibia fractures are common in children, and these injuries are currently managed nonoperatively using casts; however, a surgically implanted device would provide more structural stability and aid the healing of the fracture. Adult patients with this injury typically have a rigid intramedullary device implanted into their tibia bone. Unfortunately, these implants cannot be used in pediatric patients due to the presence of growth plates at the implantation site. A previous design team produced a working device that can enter the medullary canal through a hole in the side of the bone and then expand outward to stabilize the fracture, held in place by static friction against the canal wall. This device is flexible enough to fit into the canal, yet rigid enough to maintain fracture reduction, can be secured in place with screws, and can be removed from the canal when desired; however, the device is not fully fixated against the walls of the bone canal, and the friction force of the device is not sufficient to prevent axial rotation within the canal. This rotation can lead to device failure resulting in unnecessary pain for the patient and extra surgery to correct the issue. Last semester, this team designed a theoretical device consisting of a threaded segmented centerpiece inside of a metal biaxial braid. When the centerpiece is rotated, the braid experiences a compressive load, which causes it to expand radially. This radial expansion would ultimately provide the force to stabilize the fracture; however, the current design does not allow for sufficient force to be applied to the centerpiece.

The goal of this semester is to improve the design from last semester by strengthening the centerpiece joints, which will give us the ability to build and test a prototype, and develop a novel tool that can rotate the centerpiece when the implant is placed into a bone.

Last Week's Goals (14-7 days ago)

- Finalize specifications of final design
- Meet with Dr. Heidi Ploeg to discuss tibia models for testing
- Begin ordering materials
- Begin brainstorming for method to tighten nut on centerpiece

This Week's Goals/Individual Goals (7-0 days ago)

- Complete SolidWorks modeling of cap designs
- Contact fabrication firm
- Obtain new K-wires from Dr. Halanski
- Complete bend testing of K-wires and determine appropriate diameter to use as centerpiece for this design

This Week's Accomplishments

- Began SolidWorks modeling of cap designs – waiting on K-wire diameter which will be decided from bend testing
- Karl has been in contact with Dr. Halanski about obtaining new K-wires for bend testing; however, we do not have them yet
 - if we do not hear back, we will use the wires that we have for testing

- Meeting scheduled for training and possibly bend testing on Friday (3/7) after the advisor meeting at the Structures Lab
- Created Gantt chart for event flow this semester
- Met with Dr. Halanski and discussed method for placing the device into the bone canal

Project Difficulties

- The team experienced a setback last week when Dr. Ploeg seriously questioned the ability to compare the bending stiffness of the cast to the bending stiffness of our device given the different mechanisms by which a cast and our device function. Thus we are searching for a new way to obtain an acceptable bending stiffness for our device.

Next Week's Team Goals

- Complete bend testing of K-wires and determine final diameter for use as centerpiece in this design
- Complete SolidWorks modeling of caps, determine quantity to be ordered, and contact fabrication company
- Contact a Biomechanics, Engineering Physics, or Mechanical Engineering professor for guidance on the best method to obtain a benchmark bending stiffness for our device
- Outline plan for testing of braided cylinder

Summary of Design Accomplishments

- The team is meeting weekly to accelerate the design process
- The team has a meeting scheduled with the client to discuss goals for this semester and to obtain information about quantifying device performance constraints
- The team has met with Dr. Halanski to discuss goals for this semester
- The team has completed the Design Matrices for this semester and the Midsemester Presentation
- The team has completed the Midsemester Report

Expenses

- none at this time

Activities

Person(s)	Task	Time (hrs)	Weekly Total	Semester Total
Evan	<i>Team Role (Leader)</i>		4.0	45.0
	Weekly progress report	1.0		
	Developed next week's team goals	1.0
